In the Claims

Please amend claims 45 and 100 as follows:

1-29 (Cancelled)

30. (Withdrawn) Apparatus for use in the formation of a particulate product, comprising:  
a particle formation vessel;  
a mechanism for controlling the temperature in said vessel;  
a mechanism for controlling the pressure in said vessel; and  
an inlet for the co-introduction into the vessel of a supercritical fluid and at least one substance in  
a vehicle, the inlet comprising a first passage for introduction of the supercritical fluid and a  
second passage for introduction of the substance, the first and second passages and their  
respective outlets being arranged relative to one another such that in use, supercritical fluid  
introduced through the first passage and the substance introduced through the second passage  
both enter the particle formation vessel at the same location and such that the flow of  
supercritical fluid can act to disperse the substance at the location where the fluids meet and enter  
the particle formation vessel.

31. (Withdrawn) Apparatus according to claim 30, additionally comprising a mechanism for  
the collection and/or retention of the particulate product in the particle formation vessel.

32. (Withdrawn) Apparatus according to claim 30 additionally comprising a mechanism for  
recovering the supercritical solution, formed on extraction of the vehicle into the supercritical  
fluid, from the particle formation vessel; a mechanism for separating the components of the  
supercritical solution; and optionally a mechanism for recycling one or more of said components  
back into the apparatus.

33. (Withdrawn) Apparatus according to claim 30, comprising more than one particle  
formation vessel and more than one mechanism for the collection of the particulate product either  
in the particle formation vessel or downstream therefrom, to allow for substantially continuous  
operation of the apparatus through switching from one particle formation vessel or collection

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

mechanism to another as required.

34. (Withdrawn) Apparatus according to claim 30, wherein at least the particle formation vessel may be substantially completely sealed from the external environment during use of the apparatus.

35. (Withdrawn) Apparatus according to claim 30, wherein the mechanism for the co-introduction of a supercritical fluid and a vehicle into the particle formation vessel allows them to be introduced with concurrent directions of flow.

36. (Withdrawn) Apparatus according to claim 35, wherein the mechanism for the co-introduction of the supercritical fluid and the vehicle comprises a coaxial nozzle, the outer end of which communicates with the interior of the vessel, the nozzle having coaxial passages which terminate adjacent to one another at the outlet end, at least one of the passages serving to carry a flow of the supercritical fluid, and at least one of the passages serving to carry a flow of the vehicle in which the substance is dissolved or suspended.

37. (Withdrawn) Apparatus according to claim 36, wherein the nozzle has two coaxial passages, an inner and an outer.

38. (Withdrawn) Apparatus according to claim 36, wherein the nozzle has three coaxial passages, an inner, an intermediate and an outer.

39. (Withdrawn) Apparatus according to claims 36, wherein the opening at the outlet end of the nozzle has a diameter in the range of 0.05 to 2 mm.

40. (Withdrawn) Apparatus according to claim 36, wherein the angle of taper at the outlet end of the nozzle is approximately 30°.

41. (Withdrawn) Apparatus according to claim 37, wherein the ratio of the internal diameters of the outer and the inner passages is between about 3 and 5.

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

42. (Withdrawn) Apparatus according to claim 38, wherein the ratio of the internal diameters of the outer and intermediate passages is between about 1.4 and 1.8.

43. (Withdrawn) Apparatus according to claim 31, wherein the mechanism for controlling the temperature in the particle formation vessel comprises an oven.

44. (Withdrawn) Apparatus according to claim 30, wherein the mechanism for controlling the pressure in the particle formation vessel comprises a back-pressure regulator.

45. (Currently amended) Method for the formation of a particulate product comprising: co-introducing through respective inlet passages a flow of a supercritical fluid and a flow of a vehicle containing at least one substance into a particle formation vessel, wherein the flows of the supercritical fluid and the vehicle containing the substance both enter the vessel from said passages at the same location which is substantially the same as the location at which they meet, the inlet passages are further arranged such that the flow of supercritical fluid is used to disperse the vehicle containing the substance and that the supercritical fluid can simultaneously extract the vehicle from the substance at the location where the fluids meet.

46. (Previously presented) Method according to claim 45 further comprising controlling the temperature and pressure within the particle formation vessel.

47. (Previously presented) Method according to claim 45, wherein the co-introduction of the supercritical fluid and the vehicle is effected using a coaxial nozzle the outlet end of which communicates with the interior of the particle formation vessel, the nozzle having coaxial passages which terminate adjacent to one another at the outlet end, at least one of the passages serving to carry a flow of the supercritical fluid, and at least one of the passages serving to carry a flow of the vehicle.

48. (Previously presented) Method according to claim 45 wherein the substance is in solution in the vehicle.

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

49. (Previously presented) Method according to claim 45 wherein the substance is suspended in the vehicle.

50. (Previously presented) Method according to claim 45, wherein the supercritical fluid is carbon dioxide.

51. (Previously presented) Method according to claim 45, wherein the supercritical fluid contains one or more modifiers.

52. (Previously presented) Method according to claims 45, wherein the product to be formed is a pharmaceutical compound.

53. (Previously presented) Method according to claims 45, additionally comprising the controlling the flow rate of the supercritical fluid and the vehicle; the concentration of the substance(s) in the vehicle; and the temperature and pressure inside the particle formation vessel.

54. (Previously presented) Method according to claims 45, wherein the pressure in the particle formation vessel is maintained substantially in excess of the critical pressure for the supercritical fluid, whilst the temperature in the vessel is maintained at slightly above the critical temperature for the supercritical fluid.

55. (Previously presented) Method according to claim 45, wherein the ratio of the vehicle flow rate to the supercritical fluid flow rate is between 0.001 and 0.1.

56. (Previously presented) Method according to claim 45, additionally comprising the step of recovering and recycling the vehicle and the supercritical fluid following particle formation.

57. (Previously presented) A method for forming particulates comprising a substrate surrounded by a coating layer comprising:

contacting a coating material and a substrate with a supercritical fluid upon co-

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

introduction into a particle formation vessel.

58. (Previously presented) A method according to claim 57 wherein said coating material is provided as a solution or suspension in a first vehicle.

59. (Previously presented) A method according to claim 58 wherein said substrate is provided as a dispersion in a second vehicle.

60. (Previously presented) A method according to claim 59 wherein the coating material is in solution.

61. (Previously presented) A method according to claim 59 wherein the coating material is suspended in the first vehicle.

62. (Previously presented) A method according to claim 59 wherein the first and second vehicles are provided separately to the particle formation vessel.

63. (Previously presented) A method according to claim 59 wherein the co-introduction is such that the flow of supercritical fluid can simultaneously extract the first and second vehicles.

64. (Previously presented) Method according to claim 63, wherein the co-introduction is effected using a coaxial nozzle the outlet end of which communicates with the interior of the particle formation vessel, the nozzle having coaxial passages which terminate adjacent to one another at the outlet end, at least one of the passages serving to carry a flow of the supercritical fluid.

65. (Previously presented) A method according to claim 59, wherein the supercritical fluid, the solution or suspension and the second vehicle are co-introduced into the particle formation vessel by a nozzle having an outlet end communicating with the interior of the particle formation vessel, and two or more coaxial passages which terminate adjacent or substantially adjacent to one another at the outlet end, at least one of the passages serving to introduce a flow of the

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

supercritical fluid into the particle formation vessel, at least one of the passages serving to introduce a flow of the solution or suspension of the substance in the first vehicle and at least one of the passages serving to introduce a flow of the second vehicle.

66. (Previously presented) A method according to claim 65, wherein the solution or suspension of the substance in the first vehicle is introduced into the particle formation vessel through one passage of the nozzle, and the supercritical fluid and the second vehicle are introduced together through another passage of the nozzle, and mixing of the two vehicles occurs substantially simultaneously with their dispersion and extraction by the supercritical fluid.

67. (Previously presented) A method according to claim 66, wherein the nozzle has at least three coaxial passages, the solution or suspension being introduced between an inner and an outer flow of the supercritical fluid/second vehicle mixture.

68. (Previously presented) A method according to claim 65, wherein the nozzle has at least three coaxial passages, the outlet of at least one of the inner nozzle passages being located a small distance upstream of the outlet of one of its surrounding passages, the distance being sufficient to allow a degree of pre-mixing to occur between fluids introduced through said inner and surrounding passages, and wherein the solution or suspension and the second vehicle are introduced through the inner passage and surrounding passage in question so as to allow, in use, a degree of mixing to occur, between the solution or suspension and the second vehicle, within the nozzle.

69. (Previously presented) A method according to claim 68, wherein the nozzle has at least four coaxial passages, and wherein the solution or suspension and the second vehicle are introduced into the particle formation vessel between an inner and an outer flow of the supercritical fluid.

70. (Previously presented) A method according to claim 63 wherein the temperature and pressure within the particle formation vessel are controlled.

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

71. (Previously presented) A method according to claim 70, wherein the pressure in the particle formation vessel is maintained substantially in excess of the critical pressure for the supercritical fluid, whilst the temperature in the vessel is maintained at slightly above the critical temperature for the supercritical fluid.

72. (Previously presented) A method according to claim 59 wherein said substrate comprises a pharmaceutically active agent.

73. (Previously presented) A method according to claim 59 wherein said substrate comprises a pharmaceutically acceptable carrier.

74. (Previously presented) A method according to claim 73 wherein said coating material comprises a pharmaceutically active agent.

75. (Previously presented) A method according to claim 72 wherein said coating material comprises a pharmaceutically acceptable carrier.

76. (Previously presented) A method according to claim 75 wherein said carrier comprises a taste-masking agent.

77. (Previously presented) Method according to claim 57, wherein the supercritical fluid is carbon dioxide.

78. (Previously presented) Method according to claim 57, wherein the supercritical fluid contains one or more modifiers.

79. (Previously presented) Method according to claim 58, additionally comprising the control of the concentration of the substance(s) in the vehicle.

80. (Previously presented) A method according to claim 59, wherein a flow rate of the second vehicle into the particle formation vessel is greater than that of the solution or suspension.

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

81. (Previously presented) A method according to claim 80, wherein the ratio of the solution/suspension flow rate, into the particle formation vessel, to that of the supercritical fluid is between 0.001 and 0.2.

82. (Previously presented) A method according to claim 59, wherein the amount of the first vehicle used is less than or equal to about 30% of the total amount of the first and second vehicles used.

83. (Previously presented) A method according to claim 59, wherein one of the two vehicles contains functional groups that may interact, through hydrogen-bonding or dipole-dipole interactions, with functional groups contained in the other vehicle.

84. (Previously presented) A method according to claim 59, wherein the substance and the first vehicle are substantially polar and the second vehicle is substantially non-polar.

85. (Previously presented) A method according to claim 59, wherein the substance and the first vehicle are substantially non-polar and the second vehicle is substantially polar.

86. (Previously presented) A method according to claim 59 wherein the substance is substantially insoluble in the second vehicle.

87. (Previously presented) A method in accordance to claim 59, wherein the second vehicle contains a crystallization seed of a material which is insoluble in the second vehicle to induce nucleation of the substance when the second vehicle comes into contact with the solution or suspension of the substance in the first vehicle.

88. (Previously presented) A method in accordance to claim 87, wherein the substance is a pharmaceutical substance, and the seed comprises a pharmaceutically acceptable carrier for the substance.

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

89. (Previously presented) A method according to claim 57, which is carried out in a plural batch manner by switching between two or more particle formation vessels or between two or more means for collecting the particulate product.

90. (Previously presented) A method for forming particulates comprising a substrate surrounded by a coating layer comprising:

contacting a first vehicle containing a coating material and a second vehicle containing a substrate with a supercritical fluid.

91. (Previously presented) A method according to claim 90 wherein the contacting step comprises co-introduction of the first vehicle, second vehicle, and supercritical fluid into a particle formation vessel.

92. (Previously presented) A method according to claim 91 wherein the first and second vehicles and supercritical fluid are co-introduced such that the flow of supercritical fluid can simultaneously extract the first and second vehicles.

93. (Previously presented) A method according to claim 91 wherein the first vehicle contains a solution or suspension of the coating material and the second vehicle contains a dispersion of the substrate.

94. (Previously presented) A method according to claim 93 wherein the first and second vehicles and supercritical fluid are introduced separately into the vessel.

95. (Previously presented) A method according to claim 93 wherein said substrate comprises a pharmaceutically active agent.

96. (Previously presented) A method according to claim 93 wherein said substrate comprises a pharmaceutically acceptable carrier.

97. (Previously presented) A method according to claim 96 wherein said coating material

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

comprises a pharmaceutically active agent.

98. (Previously presented) A method according to claim 95 wherein said coating material comprises a pharmaceutically acceptable carrier.

99. (Previously presented) A method according to claim 98 wherein said carrier comprises a taste-masking agent.

100. (Currently amended) A method for forming particulates comprising a substrate surrounded by a

coating layer comprising:

controlling the temperature and pressure within a particle formation vessel; and contacting a flow of a first vehicle containing a coating material and a flow of a second vehicle containing a substrate with a supercritical fluid upon do-introduction into the particle formation vessel such that the flow of supercritical fluid can simultaneously extract the first and second vehicle.

101. (Previously presented) A method according to claim 100 wherein said first vehicle contains a solution or suspension of the coating material and the second vehicle contains a dispersion of the substrate.

102. (Previously presented) A method according to claim 101 wherein said substrate comprises a pharmaceutically active agent.

103. (Previously presented) A method according to claim 101 wherein said substrate comprises a pharmaceutically acceptable carrier.

104. (Previously presented) A method according to claim 103 wherein said coating material comprises a pharmaceutically active agent.

105. (Previously presented) A method according to claim 102 wherein said coating material

Appl. No. : 09/996,020 Appl. No. : 09/996,020  
Filed : November 27, 2001

comprises a pharmaceutically acceptable carrier.

106. (Previously presented) A method according to claim 105 wherein said carrier comprises a taste-masking agent.

107. (Previously presented) A method for separating isomers comprising:  
contacting a mixture of isomers in a first vehicle with a supercritical fluid upon co-introduction into a particle formation vessel.

108. (Previously presented) A method according to claim 107 wherein the isomer mixture and supercritical fluid are co-introduced such that the flow of supercritical fluid can simultaneously extract the first vehicle.

109. (Previously presented) Method according to claim 107 further comprising controlling the temperature and pressure within the particle formation vessel.

110. (Previously presented) Method according to claim 107, wherein the co-introduction of the supercritical fluid and the vehicle is effected using a coaxial nozzle the outlet end of which communicates with the interior of the particle formation vessel, the nozzle having coaxial passages which terminate adjacent to one another at the outlet end, at least one of the passages serving to carry a flow of the supercritical fluid, and at least one of the passages serving to carry a flow of the vehicle.

111. (Previously presented) Method according to claim 110, wherein the pressure in the particle formation vessel is maintained substantially in excess of the critical pressure for the supercritical fluid, whilst the temperature in the vessel is maintained at slightly above the critical temperature for the supercritical fluid.

112. (Previously presented) Method according to claim 107, wherein the ratio of the vehicle flow rate to the supercritical fluid flow rate is between 0.001 and 0.1.

Appl. No. : 09/996,020  
Filed : November 27, 2001

113. (Previously presented) Method according to claim 107 further comprising co-introducing a second vehicle

114. (Previously presented) A product made by the process of any one of claims 45-47, 52-55, 57-66, 70-76, 80-82, 87, 88, 90, 100 or 107-113.

115. (Previously presented) A product according to claim 114 in a single polymorphic form.

116. (Previously presented) A product according to claim 114 in a single isomeric form.

117. (Previously presented) A product according to claim 114 comprising a multi-component particulate.

118. (Previously presented) A product according to claim 114 comprising a protein.

119. (Previously presented) A product according to claim 114 comprising a sugar.

120. (Previously presented) A product according to claim 114 in amorphous form.

121. (Previously presented) A product according to claim 114 comprising a substrate provided with a coating.

122. (Previously presented) A product according to claim 114 in crystalline form

123. (Previously presented) A method according to any one of claims 115-122 further comprising administering the particulates by inhalation.
